

LatchAssist™ overcomes flat nipples to make breastfeeding more comfortable

In the days after birth, mothers may experience swollen breasts, making breastfeeding difficult and uncomfortable. The skin may also stretch so much that the nipples, which would normally be protruding, may be flat. If the baby is unable to get a flat nipple positioned correctly in his mouth he may not receive enough breast milk.

Lansinoh has developed the LatchAssist™ tool to temporarily draw out the nipple to enable a good latch – the first step to successful breastfeeding.

Infant restraint and support system from ParAid Medical

Neonates in need of transfer are often the most vulnerable. The Neo Restraint from Paraid Medical answers the need for a close-proximity infant restraining and support system to prevent injury during ambulance transfers and within hospital environments. The Neo Restraint is a multi-point securing system which fits existing infant incubators and is adjustable in three directions for different sizes of infants, positions and conditions. Its wedge design removes pressure points and raises securing strapping above the infant for non-abrasive support.

For hygiene control, comfort and practicality, Neo Restraint is made

LatchAssist can be used quickly and easily with one hand while the baby is in position to breastfeed. It comes with a small case for hygiene and portability.

Being comfortable, discreet and unbreakable, nine out of 10 mums who use LatchAssist find it effective and easy-to-use.

from 100% washable breathable fabric and strapping.

The Neo Restraint is the result of development by designers and clinicians and is one of several innovations by ParAid Medical, an ISO 9001:2000 accredited British manufacturer which specialises in patient transportation and handling systems. Neo Restraint carries the CE mark.
